      mirror to the selected
    ect.mirror mirror x
  ext.active_object is not
```

Combined Project Overview

- **Purpose:** Personal Bible study web app to manage versespecific comments across multiple Bible translations.
- Backend: REST API with full CRUD operations for user comments and verse data.
- Database: MySQL with multiple relational tables supporting key functionality.

Frontend Progress:

- Milestone 3–4: Angular app successfully connected to the backend API.
- Milestone 5: Transitioned to a React frontend integrated with the same API.
- Tools & Technologies: Node.js, Express, JavaScript/TypeScript, Postman, MySQL Workbench.

Combined Implementation and Key Learnings

Implementation:

- Successfully implemented full CRUD endpoints with Express and TypeScript.
- Frontend frameworks (Angular → React) integrated with the REST API.
- Routing established for Books, Verses, and Comments pages using Angular Router and later React Router.
- Verses displayed dynamically by translation; comments created and retrieved per verse.
- API functionality verified with Postman; database changes confirmed in MySQL Workbench.

Key Learnings:

- Define API contracts early for smoother frontend-backend integration.
- Postman testing quickly exposes backend issues before UI work.
- Modular design (services/components/hooks) improves reusability and debugging.
- Keeping schema diagrams updated prevents relational mapping errors.

Combined Challenges and Pending Issues

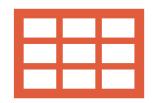

Challenges:

Aligning frontend routes (Angular/React Router) with backend API endpoints.

Debugging asynchronous API calls, data binding, and component state management.

Configuring CORS policies and environment variables for smooth communication.

Pending Issues:

Comment confirmation and book selection dropdowns remain incomplete.

Performance concerns when handling large verse datasets.

Input validation for comments still pending implementation.

Combined Next Steps / Future Work

Next Steps:

- Continue improving and expanding API documentation.
- Refine database queries and strengthen error handling for better scalability.
- Optimize performance to handle larger verse datasets efficiently.
- Complete frontend components such as comment confirmation and book selection dropdowns.
- Implement robust input validation for user comments.
- Maintain seamless integration between frontend routes (React) and backend API endpoints.
